Turtle Games Customer Analytics

By Tom Parker

Business Problem and Objectives

1. Loyalty	2. Segmentation
How do customers accumulate loyalty points?	Which customer groups should we target?
3. Reviews	**4. Prediction**
What do customers value and where are the problems?	Can loyalty points be predicted accurately?

Loyalty points

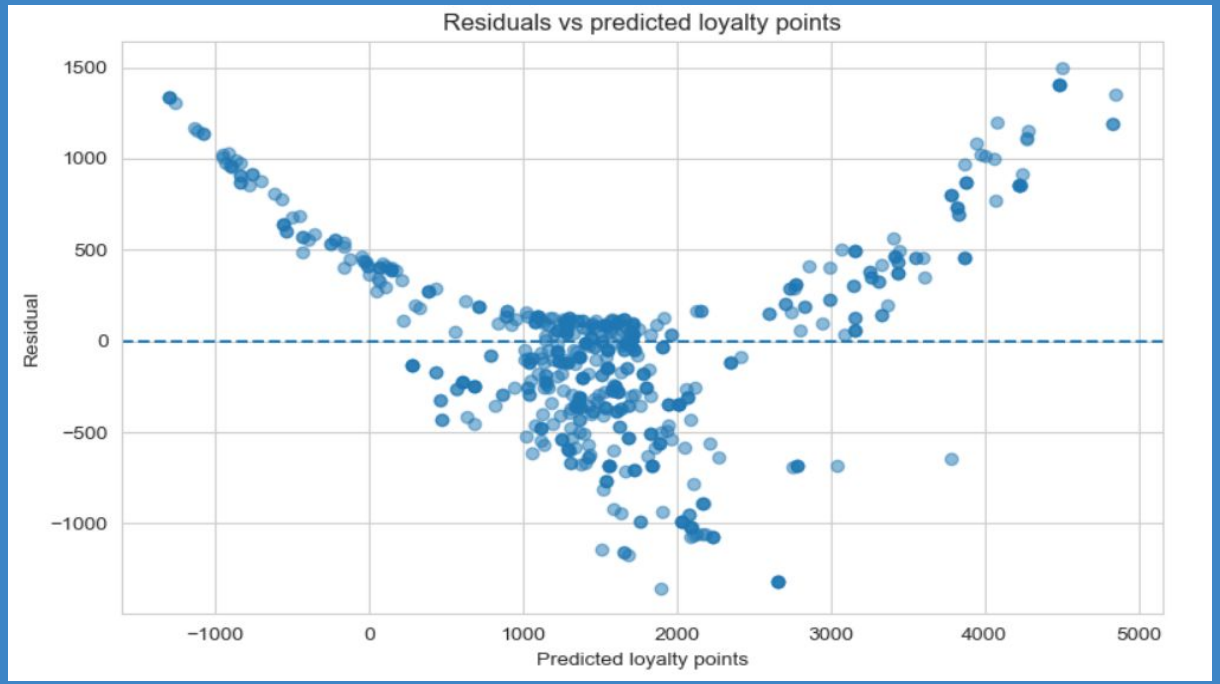

1,578
Average loyalty points

1,276
Median loyalty points

6,847
Maximum loyalty points

What Predicts Loyalty Points?

0.996

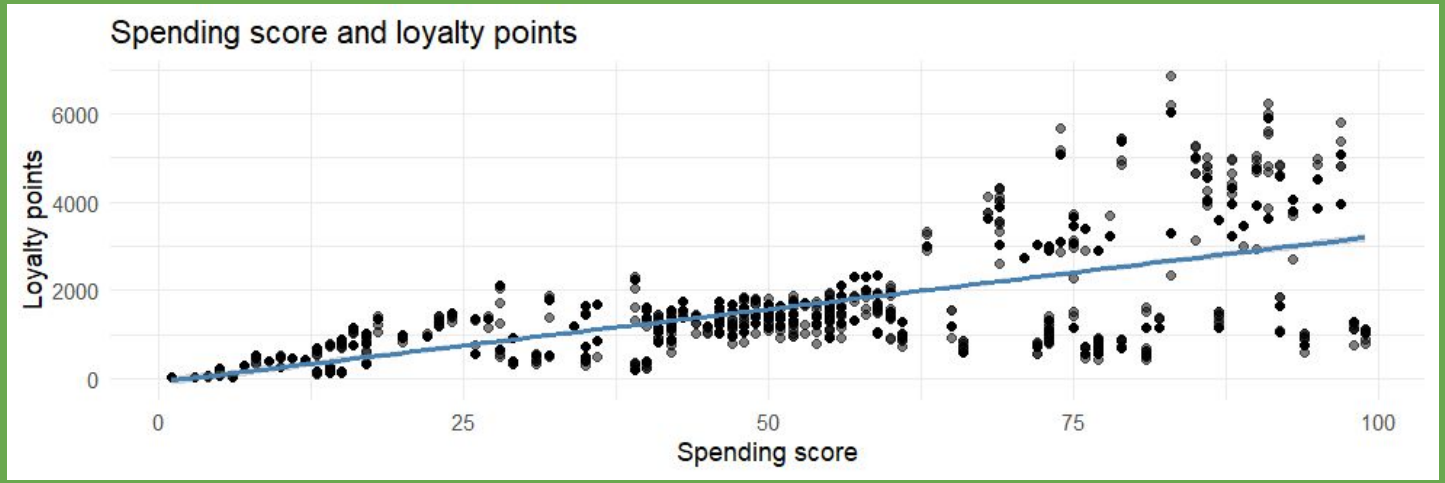

Random Forest

test R^2

Key drivers:

- Remuneration
- Spending score

Spending and Loyalty

0.67

Correlation with loyalty point

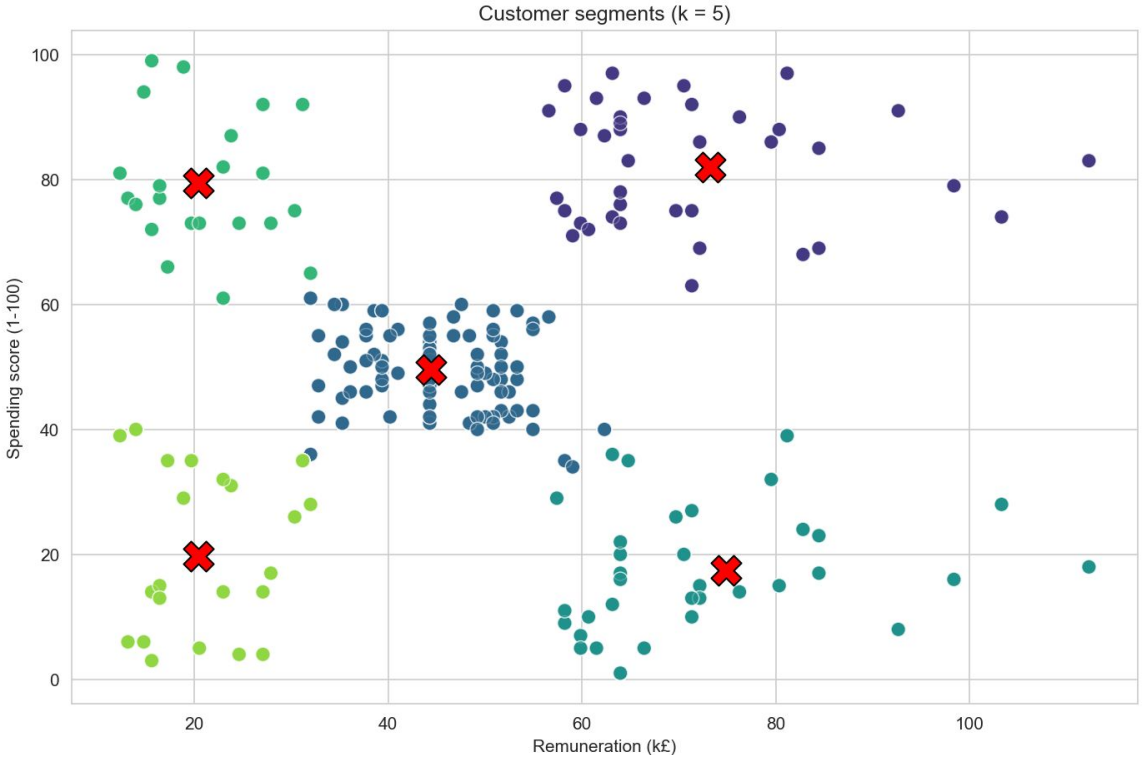

0.62

Remuneration correlation

0.04

Age correlation

Customer Segmentation

16.5%

High income / Low spend

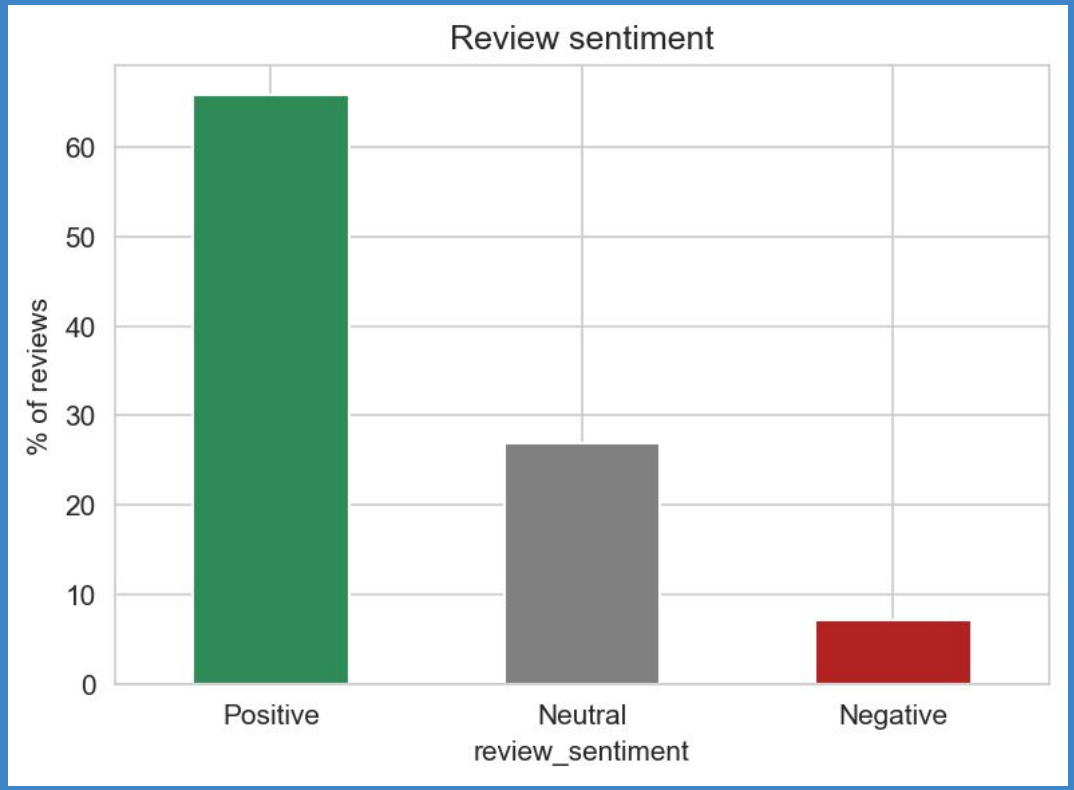

Potential opportunity for targeted offers

17.8%

High income / High spend

Opportunity to focus on retention

What do customers think?

65.8%

Positive

27.0%

Neutral

7.2%

Negative

What are customers complaining about?

Complicated instructions	**Incomplete products**
“Instructions are complicated to follow”	“Incomplete kit! Very disappointing!”
Lack of enjoyment	**Poor value for money**
“I just find this product to be boring...”	“It is expensive for what you get.”

Recommendations

1. Test targeted loyalty offers

Target the 16.5% of customers with high income but low spending. Compare a targeted campaign against a control group to measure its impact.

2. Investigate product complaints

Review complaints about instructions, incomplete kits and value for money to identify practical product improvements.

3. Validate predictive models

Confirm how loyalty points are calculated and test model performance on new data before using predictions to guide decisions.

Conclusion

Understand loyalty

Spending score and remuneration were the strongest indicators of loyalty points.

Target the right customers

Segmentation identified a high-income, low-spending group worth testing targeted offers on.

Improve the customer experience

Reviews highlighted potential improvements to instructions, product completeness and value.

Validate before acting

Test recommendations and validate predictive models using new data.
